Type 2 diabetes often develops gradually over time and is frequently preceded by prediabetes. Start with a 9-inch dinner plate (about the length of a business envelope): Fill half with nonstarchy vegetables, such as salad, green beans, broccoli, cauliflower, cabbage, and carrots. Eating carbs with foods that have protein, fat, or fiber slows down how quickly your blood sugar rises. Foods that are higher in carbs include grains, starchy vegetables (such as potatoes and peas), rice, pasta, beans, fruit, and yogurt. Common symptoms of Type 1 diabetes that eventually appear include weight loss, dehydration, frequent urination, excessive thirst and hunger, fatigue, blurry vision and wounds that won't heal. With adult-onset Type 1 diabetes, many patients are first misdiagnosed with Type 2 diabetes. It is most often diagnosed in adults after lab results indicate an elevated blood glucose level during a routine checkup with blood testing. You'll want to plan for regular, balanced meals to avoid high or low blood sugar levels. Organ damage caused by high blood sugar levels could extend to the kidneys and heart, possibly resulting in kidney disease, heart disease and stroke. A good meal plan will consider your goals, tastes, and lifestyle, as well as any medicines you're taking. Work with your doctor or a registered dietitian to find out how many carbs you can eat each day and at each meal, and then refer to this list of common foods that contain carbs and serving sizes. A good meal plan will also: Include more nonstarchy vegetables, such as broccoli, spinach, and green beans. Prediabetes occurs when blood sugar levels frequently remain higher than normal but not so high that they are classified as diabetes. Counting carbs and using the plate method are two common tools that can make planning meals easier too. A cup of milk also counts as a carb food. One entrée can equal 3 or 4 servings! Studies show that people tend to eat more when they're served more food, so getting portions under control is really important for managing weight and blood sugar. Some people with Type 2 diabetes are able to manage the disease by changing their diet and exercising several times a week. Food portions are much larger now than they were 20 years ago. At home, measure out snacks; don't eat straight from the bag or box. These days, portions at restaurants are quite a bit larger than they were several years ago. This type of diabetes occurs when the immune system attacks the cells in the pancreas that make insulin. This type of diabetes occurs when the body becomes resistant to the effects of insulin. Fill one quarter with carb foods. The Plate Method It's easy to eat more food than you need without realizing it. The plate method is a simple, visual way to make sure you get enough nonstarchy vegetables and lean protein while limiting the amount of higher-carb foods you eat that have the highest impact on your blood sugar. If you're eating out, have half of your meal wrapped up to go so you can enjoy it later. Serious Complications of Diabetes Continuously elevated blood sugar levels that occur when either type of diabetes goes untreated can lead to serious health complications over time. Prediabetes almost always exists as a warning sign before diabetes develops, but it often doesn't cause symptoms that would make it easy to spot. Circulation to the feet and other extremities could slow down, reducing oxygen to these parts of the body. A portion is the amount of food you choose to eat at one time, while a serving is a specific amount of food, such as one slice of bread or 8 ounces (1 cup) of milk. Risk factors for developing prediabetes include being overweight, eating a diet with a lot of added sugar and processed foods, inactivity, age and a family history of diabetes. Counting Carbs Keeping track of how many carbs you eat and setting a limit for each meal can help keep your blood sugar levels in your target range. Recognizing these symptoms early can help with diagnosis and quick intervention, which, in turn, often reduces the risk of more serious complications. Many of the early signs of Type 2 diabetes are the same as Type 1, such as frequent urination, increased thirst and appetite, low energy levels, wounds that won't heal and blurry vision, but people with Type 2 typically gain weight instead of lose weight and may experience numbness or tingling in their hands and feet. Our cells use insulin to control blood sugar levels in the blood and convert it to fuel for the body. When this happens, the high glucose and ketone levels can cause damage to nerves and tissues in the kidneys, heart and eyes. If the condition isn't treated, the body will eventually go into a state of diabetic ketoacidosis, which means acidic ketones build up in the blood along with excess sugar released by the liver. Symptoms of Type 1 Diabetes Many people think of Type 1 diabetes as juvenile diabetes, mainly because it often develops in children, but it can begin at any age. Carbohydrates in the food you eat raise your blood sugar levels. A clinical blood glucose check will indicate whether the child has an elevated blood glucose level and a diagnosis of Type 1 diabetes. Type 1 Diabetes — Differences Between Adults and Children Type 1 diabetes in children often manifests with weight loss, drinking large quantities of liquids, frequent urination and fatigue. Others have to take insulin injections or oral medications in addition to changing their diet and exercising. Eating about the same amount of carbs at each meal can be helpful. Symptoms of Type 2 Diabetes Type 2 diabetes affects the body in similar ways but is not physiologically the same as Type 1. Test your knowledge of portion distortion hereexternal icon. For example, drinking fruit juice raises blood sugar faster than eating whole fruit. Untreated diabetes can cause serious complications and eventually become life threatening, but early detection increases the likelihood of successfully managing the disease with an effective treatment plan. For more information, see Carb Counting. In fact, if you spot the signs of a potential problem at the prediabetes stage of the disease, you may be able to halt the progression before you ever develop Type 2 diabetes. Then choose water or a low-calorie drink such as unsweetened iced tea to go with your meal. When you consider the magnitude of that number, it's easy to understand why everyone needs to be aware of the signs of the disease. Unfortunately, many people don't notice the symptoms until the disease moves past the prediabetes phase and becomes more serious. Include fewer added sugars and refined grains, such as white bread, rice, and pasta with less than 2 grams of fiberexternal icon per serving. A meal plan is your guide for when, what, and how much to eat to get the nutrition you need while keeping your blood sugar levels in your target range. In adults, excessive symptoms of Type 1 diabetes may not appear immediately. Start by familiarizing yourself with the risk factors for diabetes and the signs you need to watch for that could indicate the onset of the disease. When the pancreas no longer makes insulin or doesn't make nearly enough insulin, it causes a lot of dangerous complications. And with this "handy" guide, you'll always have a way to estimate portion size at your fingertips: 3 ounces of meat, fish, or poultry Palm of hand (no fingers) 1 ounce of meat or cheese Thumb (tip to base) 1 cup or 1 medium fruit Fist 1–2 ounces of nuts or pretzels Cupped hand 1 tablespoon Thumb tip (tip to 1st joint) 1 teaspoon Fingertip (tip to 1st joint) Photo Courtesy: @ADA_DiabetesPro/Twitter Diabetes impacts the lives of more than 34 million Americans, which adds up to more than 10% of the population. It's also harder to diagnose at older ages because many adults don't show symptoms at first. If diabetic ketoacidosis occurs from excessive ketone buildup in the blood, it could result in a diabetic coma or even death. If you have prediabetes, lifestyle changes may be enough to halt the progression of symptoms and prevent the development of actual diabetes. Did you know? How fast carbs raise your blood sugar depends on what the food is and what you eat with it. It's important to get plenty of exercise and establish healthy eating habits with limited sugar, salt and saturated fat. In extreme cases, blurry vision could lead to diabetic retinopathy and loss of vision. About Portion Size Portion size and serving size aren't always the same. However, some people notice darkened patches of skin around the neck, armpits, elbows, knuckles and knees. Diet and exercises are important for disease management, but insulin replacement is required for those with Type 1 diabetes. That means your pancreas is making insulin, but your body isn't using it correctly. Cuts, burns and other wounds that heal slowly due to diabetes can become seriously infected, possibly leading to nerve damage or amputation of limbs. Patches of dark skin, yeast infections and itching may also occur. At dinnertime, reduce the temptation to go back for seconds by keeping the serving bowls out of reach. Fill one quarter with a lean protein, such as chicken, turkey, beans, tofu, or eggs.
